

Ancillaries

Signum Instruments' accessories provide the flexibility you need to not only work efficiently, but also handle unforeseen circumstances should they occur. Want to make operations flow more smoothly? Save time? Prevent problems? Look no further than Signum Instruments.

SWIVEL

Swivel enables free rotation between two sections of the tool string. Decouples tool string from the wireline or drill pipe during memory operations. This ensures minimal tool rotation, producing more consistent data.

SP SUB

The original logging tool, the SP Sub allows lithology identification and can be used as a means of log correlation. Use the SP Sub to determine bed boundaries, indicate porosity and permeability, and measure the difference in potential between the downhole electrode and a surface electrode.

CCL

Used as a means of depth control, the CCL responds to variances in metal volume, such as pipe collars and perforations.
